INTRODUCTION TO SECOND EDITION

It has been 16 years since the appearance of the first edition of this gazetteer. The present volume is nearly double the size of the earlier one. A small part of this growth is attributable to the addition of localities through the work of contemporary ornithologists. Most of the growth, however, is the result of the availability of more information about previously known locations, thanks to the advent of the computer. In the earlier work information was obtained from published sources, from the first-hand examination of specimens within the Field Museum and the Museum of Comparative Zoology, from field catalogs of M. A. Carriker, Jr. archived in the United States National Museum, and from a few specimens in other museums that had been examined in connection with other research. Sources of information have greatly expanded now that computer printouts for Colombian specimens have been made available by the Academy of Natural Sciences, the Carnegie Museum, the Cornell Ornithology Collection, the Natural History Museum of Los Angeles, the Museum of Natural Science, Louisiana State University, the Museum of Vertebrate Zoology, University of California, the University of Michigan Museum of Zoology, the Western Foundation for Vertebrate Zoology, and the Peabody Museum, Yale University.

In addition to this newly-available mine of information, we now have Hilty and Brown's superb *A Guide to the Birds of Colombia* (1986), which has greatly expanded our knowledge of the distribution of the avifauna through the inclusion of data obtained during their own field work, and from unpublished records of their colleagues. Because of the nature of this guide, dates and localities are frequently abbreviated (e.g., "4 Mar, Meta (Brown)" or "..., 10 Apr, upper Anchicayá Val, (Hilty)"). As a consequence, information obtained from this source is often less precise than one might need for the gazetteer.

The ease with which data within the computer may now be manipulated, compared, and dissected has aided in the identification of some sites and has also revealed some interesting facts about earlier collectors. For example, the accuracies of the dates in Serna's major paper (1980) are questionable, since it seems an unlikely coincidence, especially at infrequently visited sites, that collections were so often made at a given locality on the same date in different months (e. g., 24 April and 24 June) or on the same month and day but in different years. Some of the difficulties appear the result of Serna's confusion in transliterating months from Arabic numerals to the Roman numerals he employed in this work.

A further example of the revelations exposed by the computer is evident in the material collected by Marinkelle. It is now obvious that his records bear scrutiny, as he appears to have been at distant points, sometimes on opposite sides of the Andes, at about the same time or even on the same dates (e. g., Finca Santa Bárbara vrs. Villavicencio); perhaps he purchased specimens and substituted his name for that of the collector, a custom that has been noted for some early collectors, particularly in Ecuador. How widespread this custom was is now becoming evident as computer databases have grown and it is easier to search for congruent dates on specimens from distant localities. W. W. Brown, who has been considered to epitomize the accurate and careful collector, has some overlapping dates at Puerto Viejo, Páramo de Chirigua, Cheru, La Concepción, etc. On the other hand, von Sneidern, a prolific collector, has long been known to have been careless in labeling material but how careless he was has not been appreciated heretofore. For instance, his identification of a single locality, as ascertained by collecting dates, may take many forms (e. g., Alto de Buey; Alto de Buey, Pacific side; Alto de Buey, Bado side; Alto de Buey, Río Baudo, Alto de Buey, Río Jurubuda, etc.). Furthermore, he frequently and inconsistently appended "El Tambo," the name of his finca, to localities that are distant from his home base at El Tambo (e. g., San Antonio, El Tambo; Río Munchique, El Tambo; La Costa, El Tambo, or even El Tambo, La Costa). There are instances when the same collecting date is given to specimens

bearing either the single or the double names for the collection site, leading to the conclusion that El Tambo is *not* the locality of origin. In other instances the labelling is even more ambiguous, resulting in the recording herein of identical collection dates at widely separated places.

A change should be noted in the treatment of the comprehensive bibliography. The previous bibliography contained every known publication concerned with the Colombian avifauna, plus collateral citations that provided information not found elsewhere (e. g., a specific date or the name of a collector) but whose primary focus was not Colombian. These are now omitted from the bibliography but given in full within the text. In other words, the bibliography lists all publications on Colombian birds, without superfluous material.

It has been my good fortune to have had the generous cooperation of a number of people. Foremost has been Walter Weber of Medellín who has encouraged me and provided maps and other publications I could not otherwise have gotten. Others who have helped in various ways are D. Agro, H. Alvarez-López, K. Awbrey, C. Cicero, C. M. Dardia, K. L. Garrett, O. Hahs, J. Hinshaw, J. C. Fisher, D. F. Lane, L. G. Naranjo, A. J. Negret, M. Robbins, K.-L. Schuchmann, F. C. Sibley, F. G. Stiles, J.-M. Thiollay, D. C. Wege, and M. P. Valásquez-Sandino. And finally, Alison Pirie continues in her important role as my primary target for difficult questions and the unearther of obscure publications. Many thanks.

INTRODUCTION TO FIRST EDITION

This gazetteer does not differ materially in style or content from earlier volumes in this series. The number of entries, however, is considerably larger, and we have had to resist the temptation to speed the completion of the project by incompletely documenting every visit by a collector to a given site. As we prepare for publication of an atlas for neotropical birds, it is clear that this will be feasible only through the use of a computer and that, in turn, this will be possible only if we include in the data bank any and all of the information concerning a locality that is likely to be found in the literature or on specimen labels. In other words, an increased investment of time and effort in the gazetteer now will be vastly more than repaid by the ease and speed with which data may be retrieved and manipulated later by the computer.

The bibliography at the end of this gazetteer, with about 500 references, is believed to contain every publication devoted exclusively to Colombian birds, plus a few which refer to Colombian localities not mentioned elsewhere. Some of these publications have appeared in little-known or non-biological journals, but through the generous assistance of several Colombian friends, we have been able to examine all but one of these papers.

We have generally employed the conventions adopted in the earlier gazetteers, such as referring to the readily accessible Map of Hispanic America ("Millionth Map") whenever possible and to less well-known maps only when necessary. Again we have followed the United States Board on Geographic Names for the mode of citation and spelling of localities. The reader, however, should be alert to one problem that is particularly troublesome in this volume, viz., the fact that the boundaries of Colombia's political subdivisions have been shifted or split a number of times, resulting in a given site appearing in the ornithological literature under two or even three political divisions. We have tried to place each locality under its current political entity and also to cross-reference it to its former subdivision. We know that we have been less successful with the latter than with the former.

Unless followed by an "S", all latitudes are north of the Equator.

For help in obtaining publications and maps we are grateful to C. E. Benalcazar, G. W. Cottrell, S. L. Hilty, F. Köster, F. Medem, H. Romero Z., and W. E. Southern. S. L. Olson, of the U. S. National Museum, kindly allowed us to borrow M. A. Carriker's field catalogues for 1940-1952, enabling us to add refinements to the present list that would not have been possible from published data alone.

MUNGUIDÓ, RÍO; Chocó, 0543/7642 (USBGN); see Munguidó, Río.

MUNGUIDÓ, RÍO; Chocó 0717/7636 (USBGN) ?

Small affluent of Río Sucio [0727/7707 (USBGN)], entering the Sucio across from Pavarandó [0717/7636 (USBGN)], northern Chocó (MHA); collector ?, date ? (Haffer, 1967c:143, as "Munguidó"); by noting that "Munguidó" is in the lower Atrato valley, Haffer (loc. cit.) distinguishes this site from similarly named rivers farther S in Chocó; however, de Schauensee (1948a:312) believes "Monguido," presumably of Chapman (1917:287), a Kerr site, refers to the Río Munguidó [0543/7642 (USBGN)] which enters Río Atrato [0817/7658 (USBGN)], also a known Kerr collecting locality; this appears logical, and it may be that Haffer incorrectly identified "Munguidó," especially if the unidentified collector was Kerr.

QUINDÍO, BOQUERÓN DEL; Quindío 0438/7532 (USBGN) ?
3,480 m, pass in Central Andes on now abandoned trail between Salento [0438/7534 (USBGN)] on W and Ibagué [0427/7514 (USBGN)] on E (de Schauensee, 1948a:324, as "Quindío Pass"); Boquerón del Quindío does not appear on our maps, although a trail is shown on MHA, but that trail swings SE from Salento and reaches its highest point at ca. 0433/7529; it would appear, therefore, that the USBGN coordinates for Boquerón del Quindío are too far W and N; this would explain why de Schauensee's altitude appears to be too high for the location of the pass as indicated by the USBGN coordinates and why he gave a latitude of 0433; Fuertes, 18 May 1911 (CU, as "Quindío Pass"); Allen and Miller, short distance W of Boquerón de Quindío at Laguneta [ca. 0435/7530], 28 Aug.-13 Sept. 1911 (Chapman, 1917:32, 647).

- SANTA ISABEL, PÁRAMO DE; Risaralda ? ca. 0447/7526
 12,500 ft [3,800 m], camp in valley within páramo on [probably] western side [= western drainage] of Nevado de Santa Isabel [0447/7524 (USBGN)], a peak in Central Andes, ca. 45 km NNW of Ibagué [0427/7514 (USBGN)], Miller and Allen, up to 15,000 ft [4,650 m], 13-21 Sept. 1911 (Chapman, 1917:36-38, 651; MHA); the distinction between this locality and Santa Isabel [ca. 0447/7528] has not always been maintained (see, e.g., Chapman, 1912:144 and 1914:186, who records specimens taken at "Santa Isabel" at 12,000 ft [3,650 m] and 12,700 ft [3,875 m], on 15 and 18 Sept., dates

when collectors were at Páramo de Santa Isabel); Carriker, 21, 23 Sept. 1918, at Páramo de[I] Ruiz (Dugand, 1948a:179; CM), which Todd, 1942, Ann. Carnegie Mus., 29:365, says is equivalent to Páramo de Santa Isabel; undoubtedly locations of Santa Ignacia, Páramo del Ruiz, and Páramo de Santa Isabel have been obscured by fact that both Nevado del Ruiz [0454/7518 (USBGN)] and Nevado de Santa Isabel, which are aligned N to S, are encircled by their respective páramos, and that these meet on northern side of Nevado de Santa Isabel and on southern side of Nevado del Ruiz; thus northeastern side of Páramo del Ruiz, mentioned by de Schauensee and Todd in reference to Santa Ignacia, is from the orientation of the collecting site, probably somewhere between the two massifs and *not* on the northeastern side of Nevado del Ruiz itself.

5,860 ft [1,800 m], near La Mesa [0438/7428 (USBGN)] (Chapman, 1917:655); González, 16, 25 July 1913 (FMNH; UMMZ); de Schauensee, 1948a:333, confuses town of Subía with Cordillera del Subía [0424/7427 (USBGN)] (or Sierra de Subía as it is named on MHA), and states that altitude given by Chapman (*loc. cit.*) is too low and should be ca. 3,000 m; while the mountains do rise to 3,000 m, it is evident that town of Subía must lie on the northern slope of the range and not on its crest; no town by this name is shown on our maps and USBGN gives coordinates for two nearby Subías, viz., 0429/7422 and 0434/7427; the latter is probably the one meant by Chapman because he mentions its proximity to La Mesa whereas the former Subía lies on southern slope of range and is near Fusagasugá [0421/7422 (USBGN)]; de Schauensee (*loc. cit.*) also mentions collection recently [prior to 1948] made by Borrero at 2,600 m, which doubtless refers to the mountains, not to the town.
